Muscle Function Grading

- 0 = Total paralysis
- 1 = Palpable or visible contraction
- 2 = Active movement, full range of motion (ROM) with gravity eliminated
- 3 = Active movement, full ROM against gravity
- 4 = Active movement, full ROM against gravity and moderate resistance in a muscle specific position
- 5 = (Normal) active movement, full ROM against gravity and full resistance in a functional muscle position expected from an otherwise unimpaired person
- NT = Not testable (i.e. due to immobilization, severe pain such that the patient cannot perform the movement of limb, or contraindication of > 50% of the normal ROM)
- 0*, 1*, 2*, 3*, 4*, NT* = Non-SCI condition present*

Sensory Grading

- 0 = Absent 1 = Altered, either decreased/impaired sensation or hyperaesthesia
- 2 = Normal NT = Not testable
- 0*, 1*, NT* = Non-SCI condition present*

Note: Abnormal motor and sensory scores should be tagged with a "" to indicate an SCI. The asterisk is used to denote that the patient has an SCI. The asterisk is used in the comments box together with information about how the score is rated for classification purposes (at least normal / not normal for classification).

When to Test Non-Key Muscles:

In a patient with an apparent AIS B classification, non-key muscle functions must be tested to determine motor level on all sides and all tested to most accurately classify the injury (differentiates between AIS B and C).

| Movement | Root level |
|--|------------|
| Shoulder: Flexion, extension, abduction, adduction, internal and external rotation | C5 |
| Elbow: Supination | |
| Elbow: Pronation | C6 |
| Wrist: Flexion | |
| Finger: Flexion at proximal joint: extension | C7 |
| Thumb: Flexion, extension and abduction in plane of thumb | |
| Finger: Flexion at MCP joint | |
| Thumb: Opposition, adduction and abduction perpendicular to palm | C8 |
| Finger: Abduction of the index finger | T1 |
| Hip: Adduction | L2 |
| Hip: External rotation | L3 |
| Hip: Extension, abduction, internal rotation | |
| Knee: Flexion | L4 |
| Ankle: Inversion and eversion | |
| Toe: MP and IP extension | |
| Hallux and Toe: DIP and PIP flexion and abduction | L5 |
| Hallux: Adduction | S1 |

ASIA Impairment Scale (AIS)

- A = Complete.** No sensory or motor function is preserved in the sacral segments S4-S5.
- B = Sensory Incomplete.** Sensory but not motor function is preserved below the level of the lesion. The sacral segments S4-S5 (per perineal area, per rectal deep anal pressure) AND no motor function is preserved more than three levels below the motor level on either side of the body.
- C = Motor Incomplete.** Motor function is preserved at the most caudal sacral segments for voluntary anal contraction (VAC) OR the patient meets the criteria for sensory incomplete status (sensory function preserved at the most caudal sacral segments S4-S5 by LT, PP or DAP), and has some sparing of motor function more than three levels below the motor level on either side of the body.
- D = Motor Incomplete.** Motor function is preserved at the most caudal sacral segments for voluntary anal contraction (VAC) OR the patient meets the criteria for sensory incomplete status (sensory function preserved at the most caudal sacral segments S4-S5 by LT, PP or DAP), and has some sparing of motor function more than three levels below the motor level on either side of the body.
- E = Normal.** If sensation and motor function as tested with the ISNCSCI are graded as normal in all segments, and the patient has no sensory or motor deficits, then the patient is without an initial SCI does not receive an AIS grade.
- Using ND:** To document the sensory, motor and NLI levels, the ASIA Impairment Scale grade, and/or the zone of partial preservation (ZPP) when they are unable to be determined based on the examination results.

Steps in Classification

- The following order is recommended for determining the classification of individuals with SCI.
1. Determine sensory levels for right and left sides. The sensory level is the most caudal, intact dermatome for both per prick and light touch sensation.
 2. Determine motor levels for right and left sides. Defined by the lowest key muscle function that has a grade of at least 2 (on separate testing), providing the key muscle functions represented by segments above that level are judged to be intact (graded as a 3). Note: Sensory level is presumed to be the same as the sensory level, if available motor function above that level is also normal.
 3. Determine the neurological level of injury (NLI). This refers to the most caudal segment of the cord with intact sensation and integrity (3 or more) muscle function strength, provided that there is normal (intact) sensory and motor function caudally respectively. The NLI is the most cephalad of the sensory and motor levels determined in steps 1 and 2.
 4. Determine whether the injury is Complete or Incomplete. (i.e. absence or presence of sacral sparing) If voluntary anal contraction = No AND all S4-S5 sensory scores = 0 (Intact anal and perineal area), then injury is Complete. Otherwise, injury is Incomplete.
 5. Determine ASIA Impairment Scale (AIS) Grade. Is Injury Complete? If YES, AIS=A
NO ↓ AIS-B
NO ↓ AIS-C
NO ↓ AIS-D
 6. Determine the zone of partial preservation (ZPP). The ZPP is used only in injuries with absent motor (no VAC) OR sensory (no DAP, no LT and no PP sensation) in the lowest sacral segments S4-S5. It is the zone of the spinal cord below the NLI in which sensory and motor levels that remain partially preserved. With sacral sparing of sensory function, the sensory ZPP is not applicable and therefore "NA" is recorded in the block of the worksheet. Accordingly, if VAC is present, the motor ZPP is not applicable and is noted as "NA".
- Are at least half (half or more) of the key muscles below the neurological level of injury graded 3 or better?
- NO ↓ AIS-C
YES ↓ AIS-D
- If sensation and motor function is normal in all segments, AIS=E. Note: AIS E is used in follow-up testing when an individual with a documented SCI has recovered normal function. If at most testing no deficits are found, the individual is neurologically intact and the AIS Impairment Scale does not apply.
